## Background Information

Actin-like 6A (ACTL6A, synonyms: ACTL6, BAF53A, MGC5382) is a family member of actin-related proteins (ARPs), which share significant amino acid sequence identity to conventional actins. Both actins and ARPs have an actin fold, which is an ATP-binding cleft, as a common feature. The ARPs are involved in diverse cellular processes, including vesicular transport, spindle orientation, nuclear migration and chromatin remodeling. ACTL6A is a 53 kDa subunit protein of the BAF (BRG1/brm-associated factor) complex in mammals, which is functionally related to SWI/SNF complex in *S. cerevisiae* and *Drosophila*; the latter is thought to facilitate transcriptional activation of specific genes by antagonizing chromatin-mediated transcriptional repression. Together with beta-actin, it is required for maximal ATPase activity of BRG1, and for the association of the BAF complex with chromatin/matrix.

Selected Validation Data

Immunohistochemical analysis of paraffin-embedded human lung cancer tissue slide using 10341-1-AP (ACTL6A antibody) at dilution of 1:200 (under 10x lens). Heat mediated antigen retrieval with Tris-EDTA buffer (pH 9.0).

IP result of anti-ACTL6A (IP:10341-1-AP, 4ug; Detection:10341-1-AP 1:500) with HeLa cells lysate 1200ug.

Various lysates were subjected to SDS PAGE followed by western blot with 10341-1-AP (ACTL6A antibody) at dilution of 1:8000 incubated at room temperature for 1.5 hours.
