Background Information

Keratins are a large family of proteins that form the intermediate filament cytoskeleton of epithelial cells, which are classified into two major sequence types. Type I keratins are a group of acidic intermediate filament proteins, including K9-K23, and the hair keratins Ha1-Ha8. Type II keratins are the basic or neutral counterparts to the acidic type I keratins, including K1-K8, and the hair keratins, Hb1-Hb6. KRT19, one of type I keratins, is specifically expressed in the periderm, the transiently superficial layer that envelopes the developing epidermis. Due to its high sensitivity, KRT19 is the most used marker for detection of tumor cells disseminated in lymph nodes, peripheral blood, and bone marrow of breast cancer patients. This antibody, generated against full length KRT19 protein, also recognizes KRT17, another type I keratin homologous to KRT19.

Selected Validation Data

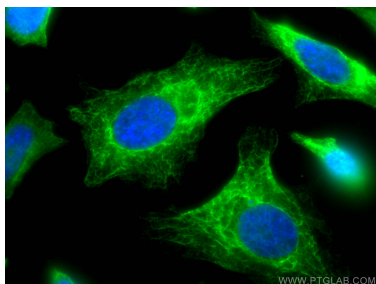

MCF7 cells were subjected to SDS PAGE followed by western blot with 14965-1-AP (Cytokeratin 19 antibody) at dilution of 1:500 incubated at room temperature for 1.5 hours.

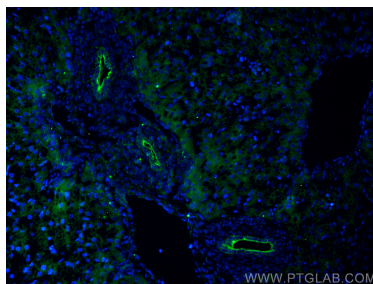

WB result of KRT19 antibody (14965-1-AP, 1:50,000) with si-Control and si-KRT19 transfected HeLa cells.

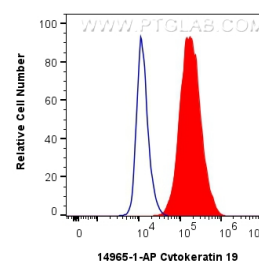

Immunohistochemical analysis of paraffin-embedded human normal colon slide using 14965-1-AP (Cytokeratin 19 antibody) at dilution of 1:300 (under 20x lens). Heat mediated antigen retrieval with Tris-EDTA buffer (pH 9.0).

Immunofluorescent analysis of (4% PFA) fixed HeLa cells using Cytokeratin 19 antibody (14965-1-AP) at dilution of 1:400 and CoraLite®488-Conjugated AffiniPure Goat Anti-Rabbit IgG(H+L).
