## Background Information

Nuclear distribution factor E-homolog 1 (NDE1), NDE-like 1 (NDEL1), and Lissencephaly 1 (LIS1) together involve in essential neurodevelopmental processes, including neuronal precursor proliferation and differentiation, neurite outgrowth, and neuronal migration. All three bind directly to Disrupted in Schizophrenia 1 (DISC1), a scaffold protein critical to neuronal proliferation, integration, migration, and synaptic function within the developing and adult brain.[PMID: 18469341] Nuclear distribution element-like 1 (NDEL1) was firstly identified as a regulator of the cytoskeleton in microtubule and intermediate filament dynamics and microtubule-based transport [PMID:21948775]. It is required for organization of the cellular microtubule array and microtubule anchoring at the centrosome, which is in part by targeting the microtubule severing protein KATNA1 to the centrosome[PMID:15728732].
