## Background Information

The family of dopamine receptors (DRs) includes five G protein-coupled receptors (GPCRs)-DRD1, DRD2, DRD3, DRD4 and DRD5-with different anatomical distribution, expression levels, dopamine affinity, signal transduction, and effector targets (PMID:36523297). DRD4 (dopamine receptor D4) influences the postsynaptic action of dopamine and is implicated in many neurological processes, exhibits polymorphism and is one of the most studied genes in connection with psychiatric disorders (PMID:21873960). Moreover, DRD4 modulate glucose metabolism, and protect neurocytes from anoxia/reoxygenation (A/R) injury. Thus, DRD4 might regulate myocardial I/R injury in association with GLUT4-mediated glucose metabolism (PMID:33584304).
