Background Information

The SIX proteins (sine oculis) are a family of homeodomain transcription factors that share a conserved DNA binding domain. Six members (Six1-Six6) of the Six gene family have been identified in mice and humans. SIX2, containing one homeobox DNA-binding domain, is highly expressed in fetal tissues but expression is limited in adult tissues. SIX2 may be involved in limb tendon and ligament development [PMID:21420949]. It has been previously shown that SIX2 is expressed in developing mesenchymal tissue including head and urogenital system at the time of overt midfacial and renal differentiation [PMID: 22282599].

Selected Validation Data

Various cells were subjected to SDS PAGE followed by western blot with 66347-1-Ig (SIX2 antibody) at dilution of 1:3000 incubated at room temperature for 1.5 hours. This data was developed using the same antibody clone with 66347-1-PBS in a different storage buffer formulation.

Immunohistochemical analysis of paraffin-embedded mouse embryo tissue slide using 66347-1-Ig (SIX2 antibody) at dilution of 1:200 (under 40x lens). Heat mediated antigen retrieval with Tris-EDTA buffer (pH 9.0). This data was developed using the same antibody clone with 66347-1-PBS in a different storage buffer formulation.
