Background Information

Pleckstrin homology (PH) domain is commonly found in eukaryotic signaling proteins and possesses multiple functions including the abilities to bind inositol phosphates and various proteins. The tandem PH domain containing protein-1 (TAPP1) or PH domain containing-family A (phosphoinositide binding specific) member 1 (PLEKHA1), interacts strongly and specifically with phosphatidylinositol 3,4-trisphosphate [PtdIns(3,4)P(2)], which is one of the immediate breakdown products of PtdIns(3,4,5) P (3) and functions as a signalling molecule in insulin- and growth-factor-stimulated pathways. TAPP1 is also associated with the protein- tyrosine-phosphatase-like protein-1 (PTPL1 also known as FAP-1) and maintains PTPL1 in cytoplasm. By binding to PtdIns(3,4) P (2) and PTPL1, TAPP1 may regulate the membrane localization of PTPL1."
