Background Information

Ubiquitously expressed transcript (UXT) is a gene transcription regulator. It can regulate androgen receptor(AR) transcription by concerting with the corepersor UR1. It is proposed a potential component of mitochondrial-associated LRPPRC, a multidomain organizer that potentially integrates mitochondria and the microtubular cytoskeleton with chromosome remodeling, for UXT increasing concentrations of UXT contributes to progressive aggregation of mitochondria and cell death potentially through its association with LRPPRC. UXT is possible a nuclear chaperone that promotes formation of the NF-kappa-B enhanceosome and which is essential for its nuclear function. It can suppresses cell transformation and mediate this function by interaction and inhibition of the biological activity of cell proliferation and survival stimulatory factors like MECOM

Selected Validation Data

HeLa cells were subjected to SDS PAGE followed by western blot with 11047-1-AP (UXT antibody) at dilution of 1:400 incubated at room temperature for 1.5 hours.

IP result of anti-UXT (IP:11047-1-AP, 3ug; Detection:11047-1-AP 1:300) with mouse brain tissue lysate 4000ug.
