Background Information

FXYD2 (FXFYD domain-containing ion transport regulator 2), also known as the gamma-subunit of the NaK-ATPase, belongs to the FXFYD family which has been proposed to be the regulators of Na, K-ATPase function by lowering affinities of the system for potassium and sodium. The expression of FXYD2 is most abundant in kidney, while it is also detected in several other tissues like placenta, pancreas, and dorsal root ganglia (DRGs). Three splice variants of FXYD2 have been reported in mouse kidney, namely FXYD2 γ a, γ b, and γ c. FXYD2 γ a has been identified as a pancreatic beta cell-specific biomarker. This antibody can recognize all three isoforms of FXYD2.
