Background Information

MYOZ2 gene encodes for the calcineurin-binding protein myozenin-2 (or Calsarcin-1) belonging to myozenin family. Defects in MYOZ2 gene are the cause of familial hypertrophic cardiomyopathy type 16 (CMH16), a hereditary heart disorder characterized by ventricular hypertrophy. The disorder has inter- and intrafamilial variability ranging from benign to malignant forms with high risk of cardiac failure and sudden cardiac death (PMID: 17347475). Myozenins may serve as intracellular binding proteins involved in linking Z line proteins such as alpha-actinin, and gamma-filamin. Important role in the modulation of calcineurin signaling and myofibrillogenesis of myozenin-2 have been elucidated (PMID: 11114196). Proteintech's Myozenin-2 antibody 11450-1-AP was raised against full-length protein of human origin and is able to detect band of approximate 34 kDa in Western blotting.
