Background Information

YME1L1(ATP-dependent zinc metalloprotease) is also named as FTSH1, YME1L, Meg-4, PAMP. YME1L1 plays a phylogenetically conserved role in mitochondrial protein metabolism. It also ensures cell proliferation, maintains normal cristae morphology and complex I respiration activity, promotes antiapoptotic activity and protects mitochondria from the accumulation of oxidatively damaged membrane proteins. YME1L1 can prevent mitochondrial DNA inserting into nuclear. It has 3 isoforms produced by alternative splicing with the molecular weight of 86 kDa, 80 kDa and 76 kDa. This protein can migrate with a molecular weight of about 55-63 kDa, which is the size of the mature YME1L1 protein(PMID:22252130; 22354088).
