Background Information

The NF1 (nuclear factor I) family consists of four members in vertebrates (NF1-A, NF1-B, NF1-C and NF1-X), and the four NF1 genes are expressed in unique patterns during mouse embryogenesis and in the adult. Four isoforms of NF1A were found in human and they play various roles in DNA replication, DNA-dependent transcription via their DNA binding property. Multiple residues of NF1A can be phosphorylated resulting in mild shifts of its practical molecular weight. Recent finding also revealed its neuroprotective function in NMDA-induced neuronal damage. Catalog# 11750-1-AP is a rabbit polyclonal antibody raised against N-terminal of human original NF1A. The calculated molecular weight of NF1A is 55 kDa, However the size of the proteins cross-linked to the adenoviral NF-1 element ranged from 60 to 80 kDa. The larger size observed by us could be due to the oligo protein complex, which would increase the size by 15-20 kDa. (PMID: 11447215)

Selected Validation Data

Immunohistochemical analysis of paraffin-embedded mouse brain tissue slide using 11750-1-AP (NFIA antibody) at dilution of 1:200 (under 40x lens). Heat mediated antigen retrieval with Tris-EDTA buffer (pH 9.0).

A431 cells were subjected to SDS PAGE followed by western blot with 11750-1-AP (NFIA antibody) at dilution of 1:1000 incubated at room temperature for 1.5 hours.

IP result of anti-NFIA (IP:11750-1-AP, 4ug; Detection:11750-1-AP 1:500) with A431 cells lysate 2000ug.
