Background Information

NDRG2, or N-myc downstream-regulated gene 2, is a tumor suppressor gene that plays a significant role in cancer development and progression. It is associated with tumor incidence, progression, and metastasis, and is known to regulate tumor-associated genes. NDRG2 is part of the NDRG family, which includes NDRG1, NDRG2, NDRG3, and NDRG4. These proteins are characterized by an esterase/lipase/thioesterase active site serine and an α/β hydrolase fold of approximately 220 amino acids, although they do not exhibit enzyme activity.
