Background Information

GPAM (Glycerol-3-Phosphate Acyltransferase, Mitochondrial) is a Protein Coding gene. This gene encodes a mitochondrial enzyme which prefers saturated fatty acids as its substrate for the synthesis of glycerolipids. This metabolic pathway's first step is catalyzed by the encoded enzyme. Two forms for this enzyme exist, one in the mitochondria and one in the endoplasmic reticulum. Two alternatively spliced transcript variants have been described for this gene. Diseases associated with GPAM include Rhizomelic Chondrodysplasia Punctata, Type 2 and Congenital Generalized Lipodystrophy. GPAM can be detected as 90-92 kDa.
