Background Information

Cadherins are a family of transmembrane glycoproteins that mediate calcium-dependent cell-cell adhesion and play an important role in the maintenance of normal tissue architecture. Cadherin-13 (CDH13, also known as H-cadherin or T-cadherin) is an atypical member of cadherin family, lacking transmembrane and cytosolic domains and anchored to the exterior surface of the plasma membrane via a GPI anchor. CDH13 is thought to affect cellular behavior largely through its signaling properties. It is highly expressed in heart, and in the CNS, CDH13 is expressed in cerebral cortex, medulla, hippocampus, amygdala, thalamus and substantia nigra. It is often down-regulated in cancerous cells. The CDH13 cDNA encodes a 713-amino acid protein, which has a calculated molecular weight of 78 kDa. Studies have detected variable bands on Western blots, including 105 kDa (mature form), 130 kDa (precursor), and 45 kDa, which may be a post-translational processing variant of CDH13 (PMID: 19399994).

Selected Validation Data

mouse heart tissue were subjected to SDS PAGE followed by western blot with 12618-1-AP (Cadherin-13 antibody) at dilution of 1:1000 incubated at room temperature for 1.5 hours. This data was developed using the same antibody clone with 12618-1-PBS in a different storage buffer formulation.

IP result of anti-Cadherin-13 (IP:12618-1-AP, 4 μ g; Detection:12618-1-AP 1:700) with mouse heart tissue lysate 4000 μ g. This data was developed using the same antibody clone with 12618-1-PBS in a different storage buffer formulation.

Immunohistochemical analysis of paraffin-embedded mouse heart tissue slide using 12618-1-AP (Cadherin-13 antibody) at dilution of 1:200 (under 10x lens). Heat mediated antigen retrieval with Tris-EDTA buffer (pH 9.0). This data was developed using the same antibody clone with 12618-1-PBS in a different storage buffer formulation.
