Background Information

MACF1, also called ACF7 (actin crosslinking family 7), is a member of the spectraplakin family and is a ubiquitously expressed 614 kDa protein. This protein facilitates actin-microtubule interactions at the cell periphery and couples the microtubule network to cellular junctions. It displays a conserved role in membrane protrusion formation during evolution. The two major MACF1 isoforms characterized to date, MACF1a and MACF1b, result from alternative splicing. Both proteins contain N-terminal actin-binding domains (ABD), followed by plakin domains, extended spectrin repeat domains, EF-hand motifs, and C-terminal microtubule-binding domains (MTBDs). MACF1 is expressed in numerous tissue, including the skin, brain, skeletal muscle, and heart.
