Background Information

ASPA (Aspartoacylase) also called aminoacylase-2, is an enzyme that hydrolyzes N-acetyl-L-aspartic acid (NAA) to aspartate and acetate. Human ASPA encodes a deduced 313-amino acid protein with a molecular mass of 36 kDa. It shares 92% sequence identity with the bovine protein and contains 1 potential N-glycosylation site and 5 phosphorylation sites. Defects in ASPA are the cause of Canavan disease (CAND). This protein can exist as a homodimer (18293939).
