Background Information	The Sex-determining Region Y (SRY)-related high-mobilitygroup box 6 (SOX6) is a transcription factor that was discovered in 1990s while searching for Sry-related genes. SOX6 belongs to the subfamily D of SOX protein and car recognize the conserved sequence of "(A/T)(A/T)CAA(A/T)C" within the transcriptional regulation region of the target gene with its HMG domain. Sox6 contains DNA binding domain and binds to the minor groove of DNA. The ability of SOX6 to interact with different proteins at different places and times, makes it an intricate protein with roles in multiple processes. SOX6 has been implicated in diabetic nephropathy, adipogenesis, cardiomyopathy, inflammatory bowel disease, and cancer. (PMID: 33230925)
