Background Information

The first group or Class I mannosidase is comprised of α 1-2 mannosidases from mammals and yeast with encoded polypeptides of 65-75 kDa. Most of them are Ca²⁺-dependent enzymes located in the ER and/or Golgi which are inhibited by substrate mimics like kifunensine and deoxymannojirimycin. Their specificity is restricted to α (1-2) linkages, and they are mostly inactive towards artificial substrates like arylmannosides (PMID:10207175).
