Background Information	Parkin, a RING-type E3 ubiquitin-protein ligase, is involved in the ubiquitination pathway and contributes to protection from neurotoxicity induced by unfolded protein stresses. Its ubiquitin-protein ligase activity promotes the degradation of a variety of proteins including itself. Mutations in Parkin are implicated in the pathogenesis of autosomal recessive familial Parkinson's disease. It has 8 isoforms produced by alternative splicing with molecular weights of 24, 31, 36 and 42-52 kDa. Sometimes an additional band of 70 kDa or 110 kDa may be detected, which is caused by ubiquitination modification or formation of Parkin complex (PMID: 10976934, PMID: 18190519).
