Background Information

Different factors catalyze the three stages of protein translation: initiation, elongation, and termination. There are two translational systems in eukaryotes, one in the cytoplasm and the other in the mitochondria. In mitochondria, the elongation phase requires three elongation factors (EF): Tu (TUFM), Ts (TSFM), and G (GFM1)[PMID:19716793]. GFM1 catalyzes translocation during peptide elongation and mediates ribosomal disassembly during ribosome recycling in concert with the ribosomal recycling factor (RRF). [PMID:16487710]
