Background Information

HKR1, also named as ZNF875, belongs to the krueppel C2H2-type zinc-finger protein family. HKR1 is a modular protein that comprises a photosensory rhodopsin, a histidine kinase, a response regulator and a putative guanylyl cyclase domain. HKR1 is related to the protonation state of the Schiff base function that provides the linkage of the retinal chromophore with a Lys side chain of the protein (PMID: 25836735). HKR1 has 2 isoforms with the molecular mass of 73-75 kDa.
