Background Information

ATP6V1D is also named as ATP6M, VATD(V-type proton ATPase subunit D) and belongs to the V-ATPase D subunit family. ATP6V1D gene has been under strong negative selection during evolution and is highly conserved among mammals, flies, worms, yeast, plants, and bacteria (PMID:11435709). It is responsible for acidifying a variety of intracellular compartments in eukaryotic cells, thus providing most of the energy required for transport processes in the vacuolar system.
