Background Information

FEM1A, also named as Protein fem-1 homolog A-A, is a 654 amino acid protein, which belongs to the fem-1 family. FEM1A is highly expressed in adult heart and skeletal muscle. FEM1A is a Probable component of an E3 ubiquitin-protein ligase complex, in which it may act as a substrate recognition subunit. FEM1A may participate in anti-inflammatory signaling via its interaction with PTGER4. Furthermore, Fem1a expression is down-regulated in rhabdomyosarcoma cells suggesting that the FEM1A gene may be involved in muscle differentiation or be at least a marker of abnormal differentiation in rhabdomyosarcoma. Knowing that a molecular weight of 76 kDa is predicted for human FEM1A, but phosphorylated FEM1A is 95-100 kDa (PMID: 19406122).
