Background Information

CFHR3, also named as DOWN16, belongs to the complement factor H-related protein family. Expressed by the liver and secreted in plasma, human CFHR3 is composed of five short consensus repeats (SCRs), and it also has a 19-amino acid signal peptide and four N-linked glycosylation sites. It may be involved in complement regulation. Deletion of CFHR1 and CFHR3 genes was found to be associated with decreased risk of age-related macular degeneration (AMD), and with an increased risk of atypical hemolytic-uremic syndrome (aHUS).
