Background Information

EIF4E3, also known as Eukaryotic translation initiation factor 4E type 3, is a 224 amino acid protein, which recognizes and binds the 7-methylguanosine-containing mRNA cap during an early step in the initiation of protein synthesis. EIF4E3 acts as a tissue-specific tumor suppressor. For instance, eIF4E3 inhibits expression of both mRNA export and translation targets of eIF4E1, consistent with its nuclear and cytoplasmic localization. Importantly, eIF4E3 overexpression represses oncogenic transformation. (PMID: 23587918). EIF4E3 exists two isoforms with MV 24 kDa and 13 kDa.
