## Background Information

HIST3H3, also known as H3.1t and H3.4, is a histone H3 protein variant that bears the H3.1 variant hallmark cysteine 96 but includes three extra amino acid substitutions. H3.1t was found to be expressed in primary human spermatocytes at the pachytene stage, similar to the human testis-specific histone H1t variant, where it appears therefore to take part in the process of spermatogenesis (PMID: 21782046).
