Background Information

FKBP9 (FK506-binding protein 9, also referred to as FKBP60 or FKBP63) belongs to a family of immunophilins that are able to bind to FK506, an immunosuppressive drug. Several members of the FKBP family, including FKBP9, FKBP13, FKBP23 and FKBP65, localize to the endoplasmic reticulum (ER) as they contain the ER retention motif H/R/KDEL (PMID:32111229). In addition, the FKBP9 mutation was also reported to be associated with disease-free survival rates in pheochromocytoma or paraganglioma (PMID:28386672).
