Background Information

Kruppel-like factor 13(KLF13) is a member of transcription factors, which contains 3 zinc finger DNA-binding domains. These transcription factors bind to CG-rich sequences and related GT and CACCC boxes. KLF13 involved in activation of transcription of variety of genes in the cells of erythroid lineage, such as GATA1, glycophorin B. It also binds to the A and A/B RANTES promoter binding sites, the same as NFκB, and then transactivates the RANTES gene. The calculated molecular weight of KLF13 is 31 kDa, but the modified KLF13 protein is about 37-45 kDa.
