Background Information

GPR50, also known as Melatonin-related receptor or H9, is a member of the G-protein coupled receptor 1 family. It is closely related to the G protein-coupled melatonin receptor family and has been demonstrated as the mammalian ortholog of Mel1c receptor (PMID: 8647286; 18400093). GPR50 does not bind melatonin. It is able to heterodimerize with both the MT1 (Mel1a) and MT2 (Mel1b) melatonin receptor subtypes. While GPR50 has no effect on MT2 function, GPR50 prevented MT1 from both binding melatonin and coupling to G proteins. GPR50 is involved in neuroendocrine function and plays a role in the regulation of energy metabolism (PMID: 8647286; 17957037).
