Background Information

ANKRD18A is an ankyrin repeat-containing protein that likely operates in the realm of epigenetic regulation, potentially influencing gene expression via DNA methylation mechanisms. Although its exact biochemical roles remain unclear, its frequent promoter hypermethylation in lung cancer, along with germline variation in vulvar skin disorders, underscores a compelling link to disease pathogenesis. Located on chromosome 9p13.1, ANKRD18A remains a compelling subject for further functional and clinical exploration.
