Background Information

RING finger protein 38 is a protein that in humans is encoded by the RNF38 gene. This gene encodes a protein with a coiled-coil motif and a RING-H2 motif (C3H2C2) at its carboxy-terminus. The RING motif is a zinc-binding domain found in a large set of proteins playing roles in diverse cellular processes including oncogenesis, development, signal transduction, and apoptosis. Alternate transcriptional splice variants, encoding different isoforms, have been characterized. RNF38 is widely expressed with highest levels in testis. RNF38 exists various isoforms and molecular weight of isoforms are 36, 48, 52 and 58 kDa
