Background Information

PHLPPL also named as KIAA0931 or PHLPP2 is a 1323 amino acid protein, which contains 22 LRR repeats, 1 PH domain and 1 PP2C-like domain. Localized to both the nucleus and the cytoplasm, PHLPPL uses manganese as a cofactor and mediates the dephosphorylation of Akt1, thereby playing a role in cell survival and apoptotic regulation. Multiple isoforms of PHLPPL exist due to alternative splicing events.
