## Background Information

Glucose-6-phosphatase- $\alpha$  (G6PC) is a key enzyme in glucose homeostasis that catalyzes the hydrolysis of glucose-6-phosphate to glucose and phosphate in the terminal step of gluconeogenesis and glycogenolysis. G6PC activity is restricted to the liver, the kidney cortex, and the small intestine and confers on these three organs the capacity to release glucose into the systemic circulation (PMID: 21983240). The encoded enzyme is anchored to the ER by nine transmembrane helices with the amino (N)-terminus in the lumen and the carboxyl (C)-terminus in the cytoplasm (PMID: 15542400).
