## Background Information

A1CF, also known as Apobec-1 complementation factor, is an RNA-binding protein that plays a crucial role in the post-transcriptional editing of apolipoprotein B (apoB) mRNA. It is a component of the enzyme complex responsible for converting a CAA codon for glutamine to a UAA stop codon in apoB mRNA, resulting in the production of a truncated protein, apoB48, instead of the full-length apoB100.

## Storage

**Storage:**  
Store at -20°C. Stable for one year after shipment.
