Background Information

Uroplakins are a group of urothelial differentiation-related membrane proteins. They are components of the asymmetric unit membrane (AUM), which forms the apical plaques of mammalian urothelium and is believed to play a role in strengthening the urothelial apical surface thus preventing the cells from rupturing during bladder distention (PMID: 8175808). Uroplakin-1B (UPK1B) belongs to the tetraspanin (TM4SF) family. UPK1B can promote the proliferation, invasion and metastasis of tumor cells and regulate the development and progression of tumors (PMID: 30229818).
