Background Information

Profilaggrin is a major protein component of the keratohyalin granules of mammalian epidermis. It is initially expressed as a large polyprotein precursor, which is subsequently proteolytically processed into individual functional filaggrin molecules. The free filaggrin binds to keratin intermediate filaments, causing their aggregation into macrofibrils in which the intermediate filaments are aligned in tightly packed parallel arrays. Mutations in Filaggrin are associated with Ichthyosis vulgaris and Dermatitis atopic 2. (PMID: 19386895, 16550169)

Selected Validation Data

Immunohistochemical analysis of paraffin-embedded human paracancerous of skin squamous cell cancer tissue slide using 26931-1-AP (Filaggrin antibody) at dilution of 1:600 (under 20x lens). Heat mediated antigen retrieval with Tris-EDTA buffer (pH 9.0). This data was developed using the same antibody clone with 26931-1-PBS in a different storage buffer formulation.
