| Background Information | Beta Catenin( $\beta$ -catenin), also known as CTNNB1, is an evolutionarily conserved, multifunctional intracellular<br>protein. $\beta$ -catenin is a key downstream component of the canonical Wnt pathway that plays diverse and critical<br>roles in embryonic development and adult tissue homeostasis.Deregulation of $\beta$ -catenin activity is associated w<br>multiple diseases including cancers. The N-terminal (1-49 amino acids) of $\beta$ -catenin is the key region for its<br>stability and the degradation by ubiquitin-proteasome system, and phosphorylation of $\beta$ -catenin at the N-termin<br>Ser33, Ser37, Thr41, and Ser45 promotes its ubiquitination and degradation(PMID: 31930681). |   |                                     |   |  |

## Selected Validation Data

Non-treated HeLa cells and Calyculin A treated HeLa cells were subjected to SDS PAGE followed by western blot with 28776-1-AP (Phospho-Beta Catenin (Ser37) antibody) at dilution of 1:600 incubated at room temperature for 1.5 hours. The membrane was stripped and re-blotted with GAPDH antibody as loading control.
