Background Information

Histones, including H1/H5 (linker histones), H2, H3, and H4 (core histones), are nucleic proteins which interact with DNA to form the nucleosomes and play important roles in gene regulation and DNA replication. Histone proteins are highly post-translationally modified while Histone H3 is the most extensively modified.

Selected Validation Data

Untreated and Trichostatin A treated HeLa cell lysates were subjected to SDS PAGE followed by western blot with 29133-1-AP (Mono-Acetyl-Histone H3 (Lys9) antibody) at dilution of 1:6000 incubated at room temperature for 1.5 hours.

WB result of Mono-Acetyl-Histone H3 (Lys9) antibody (29133-1-AP; 1:2400; incubated at room temperature for 1.5 hours) with sh-Control and sh-Mono-Acetyl-Histone H3 (Lys9) transfected HEK-293 cells.
