**Background Information** 

Ribosomal protein S6 (RPS6), Phosphoprotein NP33.It may play an important role in controlling cell growth and proliferation through the selective translation of particular classes of mRNA. Ribosomal protein S6 is the major substrate of protein kinases in eukaryote ribosomes. The phosphorylation is stimulated by growth factors, tumor promoting agents, and mitogens. It is dephosphorylated at growth arrest. Phosphorylated at Ser-235 and Ser-236 by RPS6KA1 and RPS6KA3; phosphorylation at these sites facilitates the assembly of the preinitiation complex.

## **Selected Validation Data**

Non-treated NIH/3T3 and PDGF (HZ-1215) treated NIH/3T3 cells were subjected to SDS PAGE followed by western blot with 29223-1-AP (Phospho-S6 Ribosomal protein (Ser235/236) antibody) at dilution of 1:2000 incubated at room temperature for 1.5 hours.
