Background Information

Gasdermins, a family of five pore-forming proteins (GSDMA-GSDME) in humans expressed predominantly in the skin, mucosa and immune sentinel cells, are key executioners of inflammatory cell death (pyroptosis), which recruits immune cells to infection sites and promotes protective immunity. GSDMA was predicted to enable phosphatidylinositol-4,5-bisphosphate binding activity, phosphatidylinositol-4-phosphate binding activity, and phosphatidylserine binding activity. Involved in apoptotic process.

Storage

Storage:

Store at -20°C. Stable for one year after shipment.

Selected Validation Data

Various lysates were subjected to SDS PAGE followed by western blot with 30354-1-AP (GSDMA antibody) at dilution of 1:7000 incubated at room temperature for 1.5 hours.
