Background Information

GPR52, or G protein-coupled receptor 52, is an orphan G protein-coupled receptor (GPCR) that constitutively increases cellular cAMP levels and is coupled to the Gs protein, which activates adenylate cyclase. Agonism of GPR52 has been proposed as a therapeutic intervention for the psychotic and cognitive aspects of schizophrenia. Its role in modulating neurotransmission and the identification of ligands that can interact with it highlight its potential in therapeutic development.
