Background Information

Bromodomain and WD repeat-containing protein 3 (BRWD3) is thought to regulate gene expression through its interactions with chromatin. BRWD3 promotes the K48-linked polyubiquitination and degradation of KDM5, which depends on BRWD3 and Cul4. This function is critical for maintaining H3K4 methylation levels and regulating gene expression (PMID: 37722046). Mutations of BRWD3 are associated with a spectrum of cognitive disabilities and X-linked macrocephaly (PMID: 17668385).
