Background Information

Oncostatin M (OSM) is a member of interleukin-6 family cytokines that modulates proliferation and differentiation in numerous cells (PMID: 22982441). OSM signals via a receptor complex comprising gp130 and the OSMR (also referred to as OSMR β) (PMID: 8999038). OSMR is a single-pass membrane protein which belongs to the type I cytokine receptor family. OSMR mRNA is expressed at relatively high levels in all neural cells as well as fibroblast, epithelial and a variety of tumor cell lines (PMID: 8999038). It has also been shown that OSMR associates with IL31RA to form the heterodimeric IL31 receptor (PMID: 15184896).
