## Background Information

FASN gene codes for an enzyme essential for de novo fatty acid synthesis and cellular substrate energy metabolism. Active FASN is a homodimer in which each peptide subunit has a molecular weight of 260 kDa. FASN is overexpressed in various types of cancer including glioblastomas and is a potential therapeutic target. Recently FASN has been reported to contribute to the neurogenesis since FASN mutation caused intellectual disability in mice.

## Selected Validation Data

Immunofluorescent analysis of (-20°C Methanol) fixed HeLa cells using FASN antibody (81079-1-RR, Clone: 1L9 ) at dilution of 1:1000 and CoraLite®488-Conjugated AffiniPure Goat Anti-Rabbit IgG(H+L). This data was developed using the same antibody clone with 81079-1-PBS in a different storage buffer formulation.

Various lysates were subjected to SDS PAGE followed by western blot with 81079-1-RR (FASN antibody) at dilution of 1:20000 incubated at room temperature for 1.5 hours. This data was developed using the same antibody clone with 81079-1-PBS in a different storage buffer formulation.

Biolayer interferometry (BLI) kinetic assays of 81079-1-RR against Human FASN were performed. The affinity constant is below 1 pM.
