Background Information

HSP70 (also referred to HSP72), is a stress-inducible member of heat-shock protein 70 (HSP70) proteins which are highly conserved chaperons implicated in protein folding, protein refolding, protein transport, and protein targeting. HSP70 is a cytosol/nuclear protein able to translocate between cytoplasm and nucleus. Generally, HSP70 is thought to be expressed in unstressed normal cells at low or undetectable levels. Expression of HSP70 protein can be highly activated by various stressful stimuli. Significant up-regulation of HSP70 has been found in various tumors. Recently it has been reported that HSP70 can be constitutively expressed in selected cell types. HSP70 is also used as exosomal marker.

Selected Validation Data

Various lysates were subjected to SDS PAGE followed by western blot with 84873-4-RR (HSPA1B antibody) at dilution of 1:10000 incubated at room temperature for 1.5 hours. This data was developed using the same antibody clone with 84873-4-PBS in a different storage buffer formulation.

Biolayer interferometry (BLI) kinetic assays of 84873-4-RR against Human HSPA1B were performed. The affinity constant is 9.62 nM.
