Background Information

BRD2 (Bromodomain-containing protein 2), also known as RING3, is a member of the Bromodomain and Extra-Terminal (BET) family of proteins. These proteins contain two bromodomains and one extra-terminal domain. BRD2 primarily localizes to the nucleus and functions as an atypical protein kinase. Its main role involves the activation of E2F1 and E2F2 proteins, facilitating the production of proteins essential for the G1/S phase transition of the cell cycle. BRD2 specifically recognizes acetylated histones through its bromodomains, particularly acetylated lysine residues on histones H3 and H4. This interaction allows BRD2 to recruit various transcription factors, co-activators, and repressors, thereby modulating transcriptional activity. BRD2 plays a crucial role in chromatin remodeling by recruiting proteins such as histone deacetylases. It is highly expressed during neural tube development and closure, making it essential for neurogenesis and embryogenesis. (PMID: 33462181, PMID: 37926722)
