Background Information

Vesicle amine transport protein 1 (VAT1) is expressed in neurons and neuroendocrine cells, where it participates in vesicular monoamine uptake and in the docking/fusion steps of neurotransmitter release. Beyond the nervous system, VAT1 binds anionic phospholipids (phosphatidic acid and phosphatidylserine) and catalyses their inter-membrane transfer, thereby integrating lipid metabolism with vesicle trafficking. Recent tumour-biology studies have revealed that VAT1 is frequently up-regulated in aggressive gliomas and gastric cancers; its abundance correlates with enhanced cell migration, radioresistance and an immunosuppressive micro-environment.
