Background Information

KIF7(Kinesin family member 7) is a microtubule interacting protein that functions to regulate Hh signaling by maintaining the architecture of the primary cilium, a complex microtubule-based organelle with many signal transduction functions (PMID: 26439735). KIF7 has been shown to have both negative and positive roles in Shh signal transduction. Without a ligand, KIF7 localizes to the cilium base where it forms a complex with Gli proteins and other pathway components and promotes the processing of GliRs (PMID: 21552264).
