## Background Information

Tau is hyperphosphorylated during aging and in age-related neurodegenerative diseases such as Alzheimer's disease (AD) and fronto-temporal dementia. Hyperphosphorylation of Tau leads to the formation of neurofibrillary tangles (NFT) in the neurons and glia cells, which is one of the hallmarks of AD.

## Selected Validation Data

Non-treated mouse brain tissue, phosphatase inhibitor treated mouse brain tissue and phosphatase treated mouse brain tissue were subjected to SDS PAGE followed by western blot with 86973-2-RR (Phospho-TAU (Thr212) antibody) at dilution of 1:2000 incubated at room temperature for 1.5 hours. The membrane was stripped and re-blotted with Beta Actin (66009-1-Ig) antibody as a loading control.
