Background Information

The HSD11B2 gene encodes the type II isoform of 11-beta-hydroxysteroid dehydrogenase, a microsomal enzyme complex responsible for the interconversion of biologically active cortisol and inactive cortisone. This protein catalyzes the cortisol-to-cortisone reaction. This protein expresses approximately 44 kDa in placenta, trophoblast, and distal colon, but in kidney tissue, there are two bands of approximately 44 and 48 kDa can be consistently observed and no signal is seen in decidua, adrenal, or liver (PMID:9048640).

Selected Validation Data

Various lysates were subjected to SDS PAGE followed by western blot with 87244-1-RR (HSD11B2 antibody) at dilution of 1:10000 incubated at room temperature for 1.5 hours. This data was developed using the same antibody clone with 87244-1-PBS in a different storage buffer formulation.

Biolayer interferometry (BLI) kinetic assays of 87244-1-RR against Human HSD11B2 were performed. The affinity constant is below 1 pM.
